Overall summary

We carried out an announced comprehensive inspection on 14 March 2017 to ask the practice the following key questions; Are services safe, effective, caring, responsive and well-led?

Our findings were:

**Are services safe?**

We found that this practice was providing safe care in accordance with the relevant regulations.

**Are services effective?**

We found that this practice was providing effective care in accordance with the relevant regulations.

**Are services caring?**

We found that this practice was providing caring services in accordance with the relevant regulations.

**Are services responsive?**

We found that this practice was providing responsive care in accordance with the relevant regulations.

**Are services well-led?**

We found that this practice was providing well-led care in accordance with the relevant regulations.

Hamsey Green Dental Surgery is a mixed NHS and private practice in Warlingham, Surrey which offers a range of general dental treatment to adults and children. The premises are located on the ground and first floor of a converted residential property and consist of four dental treatment rooms, a reception and waiting area and a separate decontamination room.

The staff at the practice consist of a principal dentist, six associate dentists, a practice manager, two dental nurses, four trainee dental nurses and two receptionists.

The principal dentist is the registered manager. A registered manager is a person who is registered with the Care Quality Commission to manage the service. Like registered providers, they are ‘registered persons’. Registered persons have legal responsibility for meeting the requirements in the Health and Social Care Act 2008 and associated Regulations about how the practice is run.

Our key findings were:

- There was an induction programme for staff to follow which ensured they were skilled and competent in delivering safe and effective care and support to patients.
Summary of findings

• The practice ensured staff maintained the necessary skills and competence to support the needs of patients.

• There were effective systems in place to reduce the risk and spread of infection. We found the treatment rooms and equipment were visibly clean.

• There were systems in place to check equipment had been serviced regularly, including the dental air compressor, autoclaves, fire extinguishers and the X-ray equipment.

• We found the dentists regularly assessed each patient’s gum health and the dentist took X-rays at appropriate intervals.

• The practice kept up to date with current guidelines when considering the care and treatment needs of patients.

• The practice placed an emphasis on the promotion of oral and general health and the prevention of dental disease. Appropriate information and advice was available according to patients’ individual needs.

• Staff had been trained to handle emergencies and appropriate medicines and life-saving equipment were readily available.

• Patients received assessments of their oral health needs. They were given clear explanations about their proposed treatment, and its costs, benefits and risks and were involved in making decisions about it.

• Patients were treated with dignity and respect and confidentiality was maintained.

• The appointment system met the needs of patients and waiting times were kept to a minimum.

• There was an effective complaints system and the practice was open and transparent with patients if a mistake had been made.

• Staff demonstrated knowledge of the practice whistleblowing policy and were confident they would raise a concern about another staff member’s performance if it was necessary.

• At our visit we observed staff were kind, caring, very welcoming and worked well as a team.

• There was an effective system in place to act on feedback received from patients and staff.

• We reviewed 36 CQC comment cards that had been completed by patients prior to our inspection. Common themes were patients felt they received excellent care in a calm and hygienic environment from staff who were caring, reassuring and informative. Several patients specifically commented how staff had been particularly supportive with their anxieties and had taken time to put them at ease.

There were areas where the provider could make improvements and should:

• Review the practice’s recruitment policy and procedures to ensure character references for new staff as well as proof of identification are requested and recorded suitably.
The five questions we ask about services and what we found

We always ask the following five questions of services.

**Are services safe?**
We found that this practice was providing safe care in accordance with the relevant regulations.

The practice had systems in place for the management of infection control, clinical waste segregation and disposal, management of medical emergencies and dental radiography. We found the equipment used in the practice was well maintained and in line with current guidelines.

There were systems in place for identifying, investigating and learning from incidents relating to the safety of patients and staff members. The staffing levels were suitable for the provision of care and treatment.

The practice carried out occasional conscious sedation for anxious patients. Patients were appropriately assessed and monitored prior to and during sedation. We found there were no written protocols in place and staff were not up to date with their training.

**Are services effective?**
We found that this practice was providing effective care in accordance with the relevant regulations.

The practice provided evidence based dental care which was focused on the needs of the patients. We saw examples of effective collaborative team working.

The staff were up-to-date with current guidance and received professional development appropriate to their role and learning needs. The exception to this was in relation to the provision of conscious sedation. Staff, who were registered with the General Dental Council (GDC), had frequent continuing professional development (CPD) training and were meeting the requirements of their professional registration.

**Are services caring?**
We found that this practice was providing caring services in accordance with the relevant regulations.

Patients commented they had very positive experiences of dental care provided at the practice. Patients felt they received excellent care in a calm and hygienic environment from staff who were caring, reassuring and informative. On the day of our inspection we observed staff to be caring, friendly and very welcoming. Staff spoke with enthusiasm about their work and were proud of what they did. Some staff had worked at the practice for several years and demonstrated they cared about their patients and understood their individual needs well.

**Are services responsive to people's needs?**
We found that this practice was providing responsive care in accordance with the relevant regulations.

The practice provided friendly and personalised dental care. Patients could access routine treatment and urgent or emergency care when required. The practice offered dedicated emergency appointments each day enabling effective and efficient treatment of patients with dental pain.

There was an effective system in place to acknowledge, investigate and respond to complaints made by patients.
### Are services well-led?

We found that this practice was providing well-led care in accordance with the relevant regulations.

The dental practice had effective risk management structures in place. Staff told us the practice management team were always approachable and the culture within the practice was open and transparent. All staff were aware of the practice ethos, philosophy and values and told us they felt well supported and able to raise any concerns where necessary. Staff told us they enjoyed working at the practice and felt part of a team.
Background to this inspection

We carried out this inspection under Section 60 of the Health and Social Care Act 2008 as part of our regulatory functions. This inspection was planned to check whether the registered provider was meeting the legal requirements and regulations associated with the Health and Social Care Act 2008.

The inspection was carried out on 14 March 2017 by a CQC inspector and a dental specialist advisor.

We reviewed information received from the provider prior to the inspection. On the day of our inspection we looked at practice’s policies and protocols, clinical patient records and other records relating to the management of the service.

We spoke with the principal dentist, the practice manager, two associate dentists, a dental nurse, a trainee dental nurse and a receptionist. We reviewed 36 CQC comment cards that had been completed by patients prior to our inspection.

To get to the heart of patients’ experiences of care and treatment, we always ask the following five questions:

• Is it safe?
• Is it effective?
• Is it caring?
• Is it responsive to people’s needs?
• Is it well-led?

This informed our view of the care provided and the management of the practice.
Are services safe?

Our findings

Reporting, learning and improvement from incidents

There was a system in place to learn from and make improvements following any accidents, incidents or significant events.

Staff understood the process for accident and incident reporting including the Reporting of Injuries, Diseases and Dangerous Occurrences Regulations 2013 (RIDDOR). We found incidents were reported, investigated and measures put in place where necessary to prevent recurrence.

Staff told us they were aware of the need to be open, honest and apologetic to patients if anything was to go wrong; this is in accordance with the Duty of Candour principle which states the same.

Reliable safety systems and processes (including safeguarding)

The practice had policies and procedures in place for child protection and safeguarding adults. This included contact details for the local authority's safeguarding team, social services and other agencies including the CQC. Staff demonstrated to us their knowledge of how to recognise the signs of abuse and neglect. There was a documented reporting process available for staff to use if anyone made a disclosure to them. This included and identified the practice's safeguarding lead.

Staff demonstrated knowledge of the whistleblowing policy and were confident they would raise a concern about another staff member's performance if it was necessary.

A risk management process had been undertaken for the safe use of sharps (needles and sharp instruments). Only the dentists were permitted to re-sheath needles where necessary in order to minimise the risk of inoculation injuries to staff.

Medical emergencies

The practice had suitable emergency resuscitation equipment in accordance with guidance issued by the Resuscitation Council UK. This included face masks for both adults and children, Medical oxygen and medicines for use in an emergency were available. Records completed showed regular checks were done to ensure the equipment and emergency medicine was safe to use. Records showed staff regularly completed training in emergency resuscitation and basic life support including the use of the automatic external defibrillator (AED). An AED is a portable electronic device that analyses life-threatening irregularities of the heart and delivers an electrical shock to attempt to restore a normal heart rhythm. Staff demonstrated they knew how to respond if a person suddenly became unwell.

Staff recruitment

There were some effective recruitment and selection procedures in place. We reviewed the employment files for five staff members. Each file contained some evidence that satisfied the requirements of relevant legislation. This included employment history and evidence of qualifications. The qualification, skills and experience of each employee had been considered as part of the recruitment process. We found there was no photographic evidence of employees’ identification and eligibility to work in the United Kingdom and there was a lack of written references. We discussed this with the practice manager who told us they had viewed each employee’s identification when they had commenced employment but had not kept a copy. They also told us in some cases verbal references had been sought but not always recorded. They assured us appropriate recruitment procedures (in line with their practice policy) would be followed in future.

Appropriate checks had been made before staff commenced employment including evidence of their professional registration with the General Dental Council (where required) and checks with the Disclosure and Barring Service had been carried out. The Disclosure and Barring Service carries out checks to identify whether a person has a criminal record or is on an official list of people barred from working in roles where they might have contact with children or adults who may be vulnerable.

Monitoring health & safety and responding to risks

There were arrangements in place to deal with foreseeable emergencies. We found the practice had been assessed for risk of fire in September 2016 by an external company and this had been reviewed each year by the practice. The practice had a health and safety risk management process in place which enabled them to assess, mitigate and monitor risks to patients, staff and visitors to the practice. There was a business continuity plan in place.

There were effective arrangements in place to meet the Control of Substances Hazardous to Health 2002 (COSHH)
Are services safe?

regulations. We looked at the COSHH file and found that risks (to patients, staff and visitors) associated with substances hazardous to health had been identified and actions taken to minimise them.

Infection control

There were effective systems in place to reduce the risk and spread of infection. There was a written infection control policy which included minimising the risk of blood-borne virus transmission which included Hepatitis B. The policy also described processes for the possibility of sharps’ injuries, decontamination of dental instruments, hand hygiene, segregation and disposal of clinical waste. The practice had followed the guidance on decontamination and infection control issued by the Department of Health, namely ‘Health Technical Memorandum 01-05 -Decontamination in primary care dental practices (HTM 01-05)’. This document and the practice policy and procedures on infection prevention and control were accessible to staff.

We examined the facilities for cleaning and decontaminating dental instruments. The practice had a designated decontamination room in accordance with HTM 01-05 guidance. A dental nurse showed us how instruments were decontaminated. They wore appropriate personal protective equipment (including heavy duty gloves and a mask) while instruments were manually decontaminated and inspected with an illuminated magnifier prior to being placed in an autoclave (sterilising machine).

We saw instruments were placed in pouches after sterilisation and dated to indicate when they should be reprocessed if left unused. We found daily and weekly tests were performed to check the steriliser was working efficiently and a log was kept of the results. We saw evidence the parameters (temperature and pressure) were regularly checked to ensure equipment was working efficiently in between service checks.

We observed how waste items were disposed of and stored. The practice had an on-going contract with a clinical waste contractor. We saw the different types of waste were appropriately segregated and stored at the practice. This included clinical waste and safe disposal of sharps.

Staff confirmed to us their knowledge and understanding of single use items and how they should be used and disposed of which was in line with guidance.

We looked at the treatment rooms where patients were examined and treated. The rooms and equipment were visibly clean. Separate hand wash sinks were available with good supplies of liquid soap and alcohol gel. Patients were given a protective bib and safety glasses to wear each time they attended for treatment. There were good supplies of protective equipment for patients and staff members.

Records showed a risk assessment process for Legionella had been carried out in June 2013. This process ensured the risks of Legionella bacteria developing in water systems within the premises had been identified and preventive measures taken to minimise risk of patients and staff developing Legionnaires’ disease. (Legionella is a bacterium found in the environment which can contaminate water systems in buildings).

There was a good supply of environmental cleaning equipment which was stored appropriately. The practice had a cleaning schedule in place that covered all areas of the premises and detailed what and where equipment should be used. This took into account national guidance on colour coding equipment to prevent the risk of infection spreading.

Equipment and medicines

There were systems in place to check equipment had been serviced regularly, including the dental air compressor, autoclave, fire extinguishers, oxygen and the X-ray equipment. We were shown the servicing certificates. A portable appliance test (PAT – this shows electrical appliances are routinely checked for safety) had been carried out in October 2014 by an appropriately qualified person to ensure the equipment was safe to use.

An effective system was in place for the prescribing, administration and stock control of the medicines used in clinical practice such as local anaesthetics. These medicines were stored safely for the protection of patients.

We found no systems were in place to monitor the Flumazenil (the medicine used as a reversal agent for conscious sedation) and we found this had recently expired in May 2016.

We were told that conscious sedation had been provided without access to the appropriate reversal agent during this
period. We discussed this with the principal dentist who told us this would not be replaced as he would not be providing conscious sedation in the future. Evidence of a formal notification was later sent to the inspector to show the sedation services had been suspended.

**Radiography (X-rays)**

We checked the practice’s radiation protection records as X-rays were taken and developed at the practice. We also looked at X-ray equipment and talked with staff about its use. We found there were arrangements in place to ensure the safety of the equipment. We saw local rules relating to each X-ray machine were available.

We found procedures and equipment had been assessed by an independent expert within the recommended timescales. The practice had a radiation protection adviser and had appointed a radiation protection supervisor.

In order to keep up to date with radiography and radiation protection and to ensure the practice is in compliance with its legal obligations under Ionising Radiation (Medical Exposure) Regulation (IR(ME)R) 2000, the GDC recommends that dentists undertake a minimum of five hours continuing professional development training every five years. We saw evidence that the dentists were up to date with this training.

Dental care records we reviewed showed the practice was justifying, reporting on and grading X-rays taken.
Are services effective?  
(for example, treatment is effective)

Our findings

Monitoring and improving outcomes for people using best practice

The dentists told us they regularly assessed each patient’s gum health and took X-rays at appropriate intervals. We asked the dentists to show us some dental care records which reflected this. Records showed a comprehensive examination of a patient’s soft tissues (including lips, tongue and palate) had been carried out and the dentists had recorded details of the condition of patients’ gums using the basic periodontal examination (BPE) scores. (The BPE is a simple and rapid screening tool that is used to indicate the level of examination needed and to provide basic guidance on treatment need). In addition they recorded the justification, findings and quality assurance of X-ray images taken.

The dentists carried out an oral health assessment for each patient which included their risk of tooth decay, gum disease, tooth wear and mouth cancer. The results were then discussed with the patient (and documented in the patient record) along with any treatment options, including risks, benefits and costs.

The practice kept up to date with other current guidelines and research in order to develop and improve their system of clinical risk management. For example, the practice referred to National Institute for Health and Care Excellence (NICE) guidelines in relation to wisdom teeth removal and in deciding when to recall patients for examination and review.

The practice carried out occasional intra-venous sedation for adults who were very nervous of dental treatment. One of the dentists in the practice was appropriately qualified and experienced and provided intra venous sedation to fit and well adult patients. They were supported by a dental nurse. [HM1]

We found that patients were appropriately assessed for sedation. We saw clinical records that showed that all patients undergoing sedation had important checks made prior to sedation. This included a detailed medical history, blood pressure and an assessment of health using the American Society of Anaesthesiologists classification system in accordance with current guidelines. The measures in place ensured that patients were being treated safely and in line with current standards of clinical practise.

We found that there were some systems in place to underpin the safe provision of conscious sedation. This included pre and post sedation treatment checks, emergency equipment requirements, medicines management, sedation equipment checks, personnel present, patients’ checks including consent, and discharge and post-operative instructions. Staff told us that patients were appropriately monitored during treatment. We found this was not recorded in the patient notes and there was no written protocol for the safe provision of conscious sedation. In addition the dental nurse who supported the dentist during conscious sedation demonstrated a good knowledge of the process; they had not received appropriate external training.[FV2][HM3]

We discussed these findings with the practice principal who provided evidence they had decided to cease providing conscious sedation in future.[FV4][HM5]

Health promotion & prevention

The practice placed an emphasis on oral disease prevention and the maintenance of good oral health as part of their overall philosophy. A range of information was available to patients including maintaining children’s oral health, preventing tooth decay and sensitive teeth.

We were told patients were given advice appropriate to their individual needs such as smoking cessation or dietary advice. This was also recorded in the dental care records we reviewed.

Staffing

There was an induction and training programme for staff to follow which ensured they were skilled and competent in delivering safe and effective care and support to patients.

Staff had undertaken training to ensure they were kept up to date with the core training and registration requirements issued by the GDC. This included areas such as responding to medical emergencies and infection control and prevention.

There was an appraisal system in place which was used to identify training and development needs.

Working with other services

Referrals for patients when required were made to other services. The practice had a system in place for referring patients for dental treatment and specialist procedures such as orthodontics and oral surgery. Staff told us where a
referral was necessary, the care and treatment required was fully explained to the patient. There was a system in place to record and monitor referrals made to ensure patients received the care and treatment they required in a timely manner.

**Consent to care and treatment**

The practice ensured informed consent from patients was obtained for all care and treatment. Staff confirmed individual treatment options, risks and benefits were discussed with each patient who then received a treatment plan and estimate of costs. We asked the dentists to show us some dental care records which reflected this. Patients were given time to consider and make informed decisions about which option they wanted. This was reflected in the comments we received from patients.

The Mental Capacity Act 2005 (MCA) provides a legal framework for health and care professionals to act and make decisions on behalf of adults who lack the capacity to make particular decisions for themselves. Staff demonstrated a good understanding of the MCA and how this applied in considering whether or not patients had the capacity to consent to dental treatment.

Staff members we spoke with were clear about involving children in decision making and ensuring their wishes were respected regarding treatment. They were familiar with the concept of Gillick competence regarding the care and treatment of children under 16. Gillick competence principles help clinicians to identify children aged under 16 who have the legal capacity to consent to examination and treatment.
Our findings

Respect, dignity, compassion & empathy

Staff explained how they ensured information about patients using the service was kept confidential. Patients’ electronic dental care records were password protected and paper records were stored securely. Staff members demonstrated their knowledge of data protection and how to maintain patient confidentiality. Staff told us patients were able to have confidential discussions about their care and treatment in one of the treatment rooms if it was required.

Patients felt they received excellent care in a calm and hygienic environment from staff who were caring, reassuring and informative. Several patients specifically commented how staff had been particularly supportive with their anxieties and had taken time to put them at ease. On the day of our inspection, we observed staff being polite, friendly and welcoming to patients.

Several staff had worked at the practice for many years and demonstrated they knew their patients well and understood their care and support needs. This was reflected in the CQC comment cards we reviewed, many of which stated that staff had consistently provided care and support over and above what had been expected.

Involvement in decisions about care and treatment

The dentists told us they used a number of different methods including clinical photographs, an intra oral camera, tooth models, pictures and leaflets to demonstrate what different treatment options involved so that patients fully understood. A treatment plan was developed following examination of and discussion with each patient.

Staff told us the dentists took time to explain care and treatment to individual patients clearly and were always happy to answer any questions. Patient feedback also confirmed that the dentists took time to explain dental treatment and options in a way the patient understood.
Are services responsive to people’s needs?
(for example, to feedback?)

Our findings

Responding to and meeting people’s needs

Staff reported (and we saw from the appointment book) the practice scheduled enough time to assess and undertake patients’ care and treatment needs. Staff told us they did not feel under pressure to complete procedures and always had enough time available to prepare for each patient. Patients told us through feedback that they always felt the dentists had enough time to listen to their concerns and answer questions.

There were systems in place to ensure the equipment and materials needed were in stock or received well in advance of the patient’s appointment. This included checks for laboratory work such as implants, crowns and dentures which ensured delays in treatment were avoided.

Tackling inequity and promoting equality

We asked staff to explain how they communicated with people who had different communication needs such as those who spoke another language. Staff told us they treated everybody according to their individual needs and welcomed patients from different backgrounds, cultures and religions. Staff told us if they were unable to communicate fully with a patient due to a language barrier they could encourage a relative or friend to attend who could translate or they would contact a translator.

Access to the service

We asked staff how patients were able to access care in an emergency or outside of normal opening hours. They told us an answer phone message detailed how to access out of hours emergency treatment. Staff told us patients requiring emergency care during practice opening hours were seen the same day wherever possible. This was reflected in patients’ feedback we reviewed.

Concerns & complaints

There was a complaints’ policy which provided staff with information about handling formal complaints from patients. Staff told us the practice team viewed complaints as a learning opportunity and discussed those received in order to improve the quality of service provided.

Information for patients about how to make a complaint was available in the practice’s waiting room. This included contact details of other agencies to contact if a patient was not satisfied with the outcome of the practice investigation into their complaint.

We looked at the practice’s procedure for acknowledging, recording, investigating and responding to complaints, concerns and suggestions made by patients and found there was an effective system in place which ensured a timely response.
Our findings

Governance arrangements
The governance arrangements of the practice were developed through a process of continual learning. The principal dentist liaised with the practice manager and staff team in order to identify where any improvements were needed. They shared responsibility for the day to day running of the practice and worked well together as a team. There were clear lines of responsibility and accountability with individual staff members identified as leads in certain areas such as infection control, fire safety and safeguarding. Staff knew who to report to if they had any issues or concerns.

The practice had purchased and implemented a comprehensive practice management system in order to monitor and improve the quality of service provided.

Leadership, openness and transparency
Staff reported there was an open and transparent culture at the practice which encouraged candour and honesty. The practice had a whistleblowing policy and staff were aware of their responsibilities under the Duty of Candour. Staff felt confident they could raise issues or concerns at any time with the practice manager or principal dentist without fear of recriminations.

Management lead through learning and improvement
The practice carried out regular audits of infection prevention and control to ensure compliance with government HTM 01-05 standards for decontamination in dental practices. The most recent audit undertaken February 2017 indicated the facilities and management of decontamination and infection control were managed well.

X-ray audits were carried out periodically, the most recent in October 2016. The results of the audits confirmed the dentists were consistently taking X-ray images which were above the required standards. This reduced the risk of patients being subjected to further unnecessary X-rays.

Additional audits were undertaken to assess and monitor the quality of services provided. These included a record keeping audit in January 2017 which indicated an appropriate standard was being maintained.

Practice seeks and acts on feedback from its patients, the public and staff
The practice regularly sought and acted upon feedback from patients where appropriate.

The practice held regular staff meetings each month where they discussed a range of topics in order to learn and improve the quality of service provided. Staff members told us they found the meetings were a useful opportunity to share ideas.

The practice also undertook the NHS Friends and Family Test (FFT). The FFT is a feedback tool which supports the fundamental principle that people who use NHS services should have the opportunity to provide feedback on their experience. The FFT results we reviewed reflected a high level of patient satisfaction.
